

METHOD, APPARATUS AND COMPUTER PROGRAM PRODUCT
FOR DEPLOYING SOFTWARE VIA POST-LOAD IMAGES

ABSTRACT

5 A method for deploying software includes providing a Web site on a server coupled to a network for presenting a user with an interface. The server has an array of post-load images stored thereon for combinations of the software and hardware that the user may select. The server receives a user selection of software applications for deploying to a target computer system and of hardware for the target system and responsively determines what drivers
10 correspond to the indicated hardware. The server then selects a certain one of the post-load images having the software applications that have been selected by the user and has the drivers for the hardware that have been selected by the user.
